

Polarographic determination of nitrobenzene. I. A. Kuchunov, A. V. Ryutov, L. N. Sazanova, and A. S.

Kirillova, Zaretskaya, *Zhur.*, 14, 819-22 (1948); cf. C.A., 43, 4385e. Nitrobenzene can be dect. polarographically in *aq.* solns. in aniline, in benzidine, and also mixed with dinitrobenzene. Reduction of nitrobenzene occurs in acid, neutral, and alk. solns. and the form of the wave in all cases is suitable for measurement. The potential of the semi-wave of the reduction of nitrobenzene is affected by the pH of the buffer soln. only in the acidic range. There is no directly proportional relationship between the diffusion current and the concn. of the nitrobenzene. The temp. coeff. of the diffusion current of nitrobenzene is about 1.5% for each degree and depends linearly upon the temp. Hence, the temp. of the test soln. must be maintained const. within 0.5-1.0°. For concns. of nitrobenzene of 10^{-6} mol/l. and higher, max.

are formed which interfere with the measurements. The addition of gelatin depresses the max. and moves the potential of the semicell to the neg. side. For dextro-, the nitrobenzene is dissolved in alc., acetone, or benzene and the resulting soln. is added to the buffer in the electrodektro in such units, that the concn. of the nitrobenzene should not exceed $10^{-4} - 2 \times 10^{-4}$ mole/l. It is necessary to compensate the maxillary current and to expel the dissolved O₂ beforehand. The latter is done by passing an inert gas through the buffer soln. before the sample is added. For concns. of about 10^{-4} mole/l. the determination can be made with an error of $\pm 2-3\%$. Dets. of small units of nitrobenzene in the presence of anilines or benzaldehydes were made by mixing the test soln. with 1 vol. of concd. HCl and 4 vol. of aniline or 2 vol. benzaldehyde and 1 vol. HCl and then polarographing. Calcs. were made from a curve showing diffusion current in microamps. against % nitrobenzene in aniline. The curve was constructed from standard solns. of nitrobenzene in aniline which did not contain nitrobenzene. At low concns. nitrobenzene and in which the HXH_n current is not over 10-15% can be detd. directly without the addition of a buffer.

Polarographic reduction of dibromoethane and carbon tetrabromide. A. V. Ryabov, S. D. Burov, and L. I. Sharov. Uchonye Zapiski MGU, Ser. 1, No. 22, p. 11, No. 2213. — The reduction of dibromoethane (I) and carbon tetrabromide (II) formed during bromination of CH_3Cl (III) and vinyl chloride (IV) with $\text{Br}-\text{H}_2\text{O}$ was studied at a dropping Hg electrode. Compounds I and II were reduced polarographically, but not carbon tetrabromide (IV), regardless of the pH. The cathodic value of the v., resp., regardless of the pH. The cathodic value of the current, i , in $E = E_{\text{ad}} - (0.05/\tau) \log (V/V_0 - 1)$ was 0.125 for I and 0.34 for II. Thus, the reduction of I and II was reversible. A mixt. of I and II was irreversibly III and IV could be analyzed polarographically. The method consisted of absorbing the gaseous product in $\text{Br}-\text{H}_2\text{O}$, containing the excess Br with a 5% soln. of Na_2S , and analyzing the solution polarographically. The max. was depressed by an addition of 0.05% gelatin. In alk. soln. II was hydrolyzed noticeably. M. Horch

Title : Magnetic Viscosimeter-Dilatometer.

Orig Pub: Zavod. laboratoriya, 1956, 22, No 9, 1111-1112

Abstract: The instrument described permits to measure simultaneously the volume and viscosity of the sample filling the reaction ampule of the instrument, having a capacity of 8-10 ml, and to determine, by repeating these measurements, changes of the above stated parameters on polymerization of the sample. The volume is calculated by determining the difference in level of the mercury contained in a U-shaped burette, or in a graduated capillary, connected with the ampule with the sample. Viscosity is determined from the rate of descent of an iron ball located in the reaction ampule. The movement of the ball can also be actuated by the

ABSTRACT: The principle component of the equipment for the purification
of the monomer from air is an ampule from which the monomers are
led into the dilatometer. The monomer to be investigated is put
into an ampule and a reception device is inserted into the air-
filled Duar vessel. After the faucet is opened a vacuum pump is
set in operation. The monomer is transferred into the reception
device, after which the faucet is turned off and the reception
device is taken out of the Duar vessel. The ampule is then placed
into the vessel and the monomer is transferred from the reception
device into the ampule. The monomer is protected against the in-
fluence of air by mercury, which is transferred from the 5th to
the 1st ampule. The investigation ended with the transfer of the
monomer from ampule 1 into the reaction ampules of the dilatometer.

TITLE: The Copolymerization of Methylmethacrylate With Methacrylic Acid

PERIODICAL: Tr. po khimii i khim. tekhnol., 1958, Nr 2, pp 270 - 272

ABSTRACT: For a mixture of monomers of 85% methylmethacrylate (I) and 15% of methacrylic acid (II) the exponential temperature dependence of the initial and maximum copolymerization rate as well as of the time of copolymerization have been established. The total energy of activation of the initial process of copolymerization is equal to 17.5 kcal/mole. The initial polymerization rate depends linearly on the concentration of benzoyl peroxide in the power of 1/2. With an increase in the content of II in a mixture with I from 0 to 0.225 molar parts the polymerization rate increases. An increase in the content of II from 0 to 0.322 molar parts results in a linear increase of the maximum polymerization rate.

PERIODICAL: The Copolymerization of Methylmethacrylate With Butylacrylate 7

ABSTRACT: The kinetics of combined polymerization of methylmethacrylate (I) with butylacrylate (II) at 60°C has been investigated; the initiator was benzoyl peroxide. The initial polymerization rate of a mixture of the composition 85% I and 15% II is proportional to the square root of the concentration of the initiator. Equations of polymerization rate have been derived for three cases: 1) the initiation takes place mainly at the expense of I; 2) the initiation takes place mainly at the expense of II; 3) the initiation takes place both at the expense of I and II approximately in an equal degree. The experimental results obey well the equation of I. From the data on the composition of polymers the constants of the com-

TITLE:

Change of the Viscosity of a Reaction System During the Block Polymerisation of Methyl Methacrylate in Methacrylic Acid (Izmeneniye vyazkosti reaktsionnoy sistemy v protsesse blochnoy polimerizatsii metilmekriliata s metakrilovoy kislotoy)

PERIODICAL:

Izvestiya vuzovskikh uchebnykh zavedeniy. Khimiya i khimicheskaya tekhnologiya, 1998, Nr 4, pp 112 - 116 (USSR)

ABSTRACT:

The viscosity properties of the reaction medium are constantly changed during the polymerization of the monomers. The viscosity-mechanical properties of the system are one of the main factors that influence the reaction velocity especially in the late stages of the polymerization (Refs 1-5). The methyl methacrylate polymerization in the presence of benzoyl peroxide is considerably accelerated beginning from about a 20% transformation (Ref 6). Also the polarization degree increases (Ref 7). The latter phenomenon (the co-

Card 1/4

Change of the Viscosity of a Reaction System During
the Block Polymerization of Methyl Methacrylate in Methacrylic Acid

SCV/153-50-4-18/22

called Trommsdorff or gel effect, Ref. 8) is connected with the radical break constant decrease, if the medium is sufficiently viscous. Although several recent papers prove the dependence of the life of free radicals on the thoroughness of the polymerization, the alteration of viscosity has never been controlled (Refs. 8-16). The authors of the present paper intended to investigate the process mentioned in the title of the mixtures of methyl methacrylate (MMA) with methacrylic acid (MAA) to the highest possible degree of transformation. It was interesting to determine the viscosity corresponding to the beginning of the reaction acceleration. Already earlier (Ref. 17), the authors described a magnetic viscosimeter-dilatometer (Fig. 1) which considerably simplifies the complex and long operations in the study of the said problem. Figures 2 and 3 show the curves of the dependence of the viscosity logarithm in poise units on the thoroughness of the transformation of the monomeric mixture consisting of

Card 2/4

Change of the Viscosity of a Reaction System During
the Block Polymerization of Methyl Methacrylate in Methacrylic Acid

85% MMA + 15% MAS, or of 82.6 MMA + 17.4 MAS, respectively at 30-60°. Figure 4 shows the curves of the alterations of viscosity during the block polymerization in the case of different compositions of the initial monomeric mixture. As may be seen herefrom the viscosity of the systems in polymerization increases with the increase of the MMA part in it. This increase is apparently connected with the increase of the potential barrier, or in other words, with the decreasing elasticity and mobility of the macromolecules at the expense of the polar MAA molecules. Hydrogen bonds between the carboxyl groups are formed there. To determine the viscosity corresponding to the initial acceleration the curve is used that characterizes the reaction velocity (Fig. 5). It could be proved that the reaction acceleration corresponds to the viscosity values between 100 and 500 poise units. Within this range the diffusion rate is then considerably decreased. Figure 6 shows the curve of the dependence of the polymerization initial velocity

TITLE:

II. The Change in Viscosity of the Reaction System During
Bulk Polymerization of Methyl Methacrylate With Methacrylic Acid

PERIODICAL:

Izvestiya vysshikh uchebnykh zavedeniy. Khimiya i khimicheskaya
tekhnologiya, 1959, Vol 2, Nr 6, pp 954-955 (USSR)

ABSTRACT:

This paper is devoted to the investigation of the viscosity during bulk polymerization of methyl methacrylate (MMA) and its mixture with methacrylic acid (MAA) in dependence on the content of various initiators in the monomer mixture. The azodinitrile of isobutyric acid (ADNB), the azodinitrile of 2,4-dimethyl valeric acid (ADNV), benzoyl peroxide (BP), and diacetyl (DA) were used as initiators. Values obtained for the initial polymerization rate of MMA in the presence of the initiators mentioned are given (Table). A diagram representing the dependence of the initial rate for the polymerization of a monomer mixture consisting of 85% MMA and 15% MA on the ADNB concentration is also given (Fig 1), from which the linear dependence of the initial polymerization rate on the square

root of the ADNB concentration may be seen. In additional figures (Figs 2 and 3), the dependence of the logarithm of viscosity on the conversion degree of MMA and its mixture with 15% MAA in the presence of various initiators is given. The change of the viscosity for a monomer-polymer mixture consisting of 85% MMA and 15% MAA in dependence on the conversion degree is also investigated for various concentrations of the initiator ADNB (Fig 4). From the table and the figures, it may be seen that the viscosity of the polymerization system corresponding to a defined conversion degree decreases with the increase in activity and the concentration of the initiator, respectively. The shapes of the curves logarithm of viscosity conversion degree of the polymerization system depend only little on the initiator used and its concentration. It was shown by an analysis of the curves of the change of the polymerization rate as well as of the curves of the change of viscosity of the reaction system (Ref 1) that the viscosity for MMA and its mixture with 15% of MAA corresponding to the gel effect is 100 to 500 P, and does not depend on the com-

TRANSLATION: Samples of polymethylmethacrylate (PMMA) obtained by block polymerization in a vacuum and under atmospheric conditions in the presence of benzoyl peroxide, azoizobutyric acid dinitrile, or by means of photoinitiation, were investigated. The presence of bathochromic displacement of UV absorption and the presence of a new maximum absorption in PMMA were disclosed. This indicates the formation of new groups. Using IR spectrometry, the assumption of formation of isolated conjugate double bonds was confirmed. Oxygen does not noticeably affect the character of the spectra of irradiated PMMA samples. A method of photo decomposition of PMMA in a vacuum was suggested. See report 2, R.Zh. Khim., 1962, 1R43. V. Agasandyan.

ABSTRACT: The authors describe a combination stand developed at the L'vov Polytechnical Institute to be used for both inertial and constant braking tests. A diagram of the installation is shown in the accompanying figure. The principal elements of the stand are: .100 kw electric motor 1; clutch and gearbox 2 mounted on the clutch bracket; flywheel 3 with a moment of inertia of 16 kg·sec²; brake mechanism 4 with the drum mounted on the flywheel shaft while the disc and shoes are mounted on the clutch shaft 5 which is coaxial with the flywheel shaft. The stand is equipped for measuring the braking moment and the moment on the release shaft, the temperatures of the brake linings and drum, the rotational velocity of the drum, the pressure in the brake chamber and rod travel. Provision is made for programmed control of brake operation. The device may be used for studying the effect of a variety of factors on the power capacity of braking mechanisms. Orig. art. has: 4 figures, 3 tables.

TITLE: Nitrogen containing peroxides as polymerization initiators of vinyl monomers. 3

SOURCE: Vyssokomolekulyarnye soyedineniya, v. 6, no. 6, 1964, 1068-1071

TOPIC TAGS: vinyl monomer, methyl methacrylate polymerization, methacrylic acid polymerization, styrene polymerization, acrylonitrile polymerization, polymerization initiator, nitrogen containing peroxide, phenylperoxycarbamate, phenylperoxy-carbamate decomposition kinetics

ABSTRACT: The purpose of the present investigation consisted of determining whether a tertiary butyl radical (located behind the peroxide bridge of the groupings N-COOO and NCH₂OO) would affect the superior performance of the N-COOO group as polymerization initiator. The initiator activities of tert.butyl-N-phenyl-peroxycarbamate (I), N-tert.butylperoxymethylbenzamide (II), and N,N'-bis-(tert.

butylperoxymethyl)urea(III) on the polymerization of methylmethacrylate, methacrylic acid, styrene, and acrylonitrile were investigated. The polymerization of methylmethacrylate was conducted in block, in the presence of 0.05 mole% of the initiator per mole of the monomer, at 18-60°C for initiator (I) and at 60°C for initiators (II) and (III). It was found that peroxide (I) was the most effective (in its presence the activation energy was 19.6 kcal/mole). Similar tests with methacrylic acid, styrene, and acrylonitrile confirmed the superior performance of the initiator containing the N-COOO grouping. Additional experiments were conducted on the kinetics of decomposition of (I) in benzene at 60-80°C. The decomposition was found to proceed generally according to a first order reaction. The activation energy was estimated as 30.5 kcal/mole. Orig. art. has: 2 charts.

TITLE: Properties of copolymerization of styrene with 2-vinylpyridine

CITED SOURCE: Tr. po khimii i khim. tekhnol. Gor'kiy, vy* p. 1, 1963, 188-189

TOPIC TAGS: copolymerization, styrene, 2-vinylpyridine, copolymer

TRANSLATION: To improve the alternation of monomeric sections in copolymer of styrene and 2-vinylpyridine (I) copolymerization of the latter in the presence of CH₃COOH (II) was studied. It was shown that, on the basis of comparing composition curves and constants of copolymerization corresponding to them, copolymers obtained in presence of 1.4 mole of II in 1 mole of I (temperature 22°, ultraviolet irradiation, $r_1=0.18\pm0.02$ and $r_2=0.36\pm0.04$) have more uniform alternation of sections than copolymers obtained in usual conditions (temperature

50°, 0.25% benzoyl peroxide, $r_1 = 0.57 \pm 0.03$ and $r_2 = 1.33 \pm 0.04$). There is suggested the mechanism of action of II founded on formation of complex of bonds between I and II due to rigid H-bonds from undivided electron pair of nitrogen, leading to appearance of excess positive charge on double bond of I. Opposite polarization of double bonds of styrene and I leads to alternation of monomers in copolymerization.

S/0020/64/154/005/135/1127

TITLE: The possibility of regulating the degree of rotation in the copolymerization of styrene with 2-vinylpyridine

SOURCE: AN SSSR. Doklady*, v. 154, no. 5, 1964, 1135-1138
TOPIC TAGS: rotation control, styrene, vinylpyridine copolymer, vinyl-pyridine, polarity, dissociation constant, double bond polarity

ABSTRACT: To create copolymerization conditions assuring rotation in the styrene-2-vinylpyridine copolymer, the polarity of the double bond of one of the monomers must be changed. The polarity of the double bond of the 2-vinylpyridine was changed by forming complexes with proton donor materials which formed a hydrogen bond with the nitrogen atom, decreasing the electron density of the 2-vinylpyridine.

ACCESSION NR: AP4016510

The importance of the structure of this complex increases with the increase in proton donor properties of R-O-H; it can be evaluated by the dissociation constant of its aqueous solutions. The greater the dissociation constant of the material, the more the electron density of the double bond decreases; the greater the difference in polarity of the double bonds of the monomers, the greater the degree of rotation and the smaller the product $r_1 \cdot r_2$. The effect on the rotation of the monomers during copolymerization of acetic acid, phenol, methanol and ethanol decreases in the given order. In the equation

$$\lg \frac{r_1 \cdot r_2}{n_1 \cdot n_2} = -(\rho_1 + \rho_2) pK.$$

Card
2/3

ACCESSION NR: AP4016510

the relationship between the $\lg (r_1^0 \cdot r_2^0 / r_1 \cdot r_2)$ and the pK is a straight line function. Thus it is possible to obtain a copolymer with the desired structure by copolymerization in a given medium if the pK of the "acid" solution is known. Orig. art. has: 3 figures and 3 equations.

TITLE: Effect of dimethyl formamide additions on the composition of copolymers of methacrylic acid with methyl methacrylate and with styrene

PERIODICAL: Akademiya nauk SSSR. Doklady, v. 145, no. 4, 1962, 822 - 824

TEXT: The effect of adding dimethyl formamide and ethyl alcohol to mixtures of methacrylic acid with methyl methacrylate and of methacrylic acid with styrene was studied by viscosimetry. Results: (1) A distinct maximum occurring in the viscosity - composition curve proved the formation of hydrogen bonds between the carboxyl group of methacrylic acid and the polar additions. (2) Increasing the additions, particularly of dimethyl formamide, decreases the proportion of methacrylic acid because complexes are formed which diminish the reactivity. Such additions result in increasing the copolymerization constant $r_1 = K_{11}/K_{12}$ and in decreasing $r_2 = K_{22}/K_{21}$ owing to the loss in reactivity and consequent reduction of Card 1/2

TITLE:

Initiation of vinyl polymerization by organomercury compounds

PERIODICAL:

Vysokomolekulyarnyye soyedineniya, v. 4, no. 3, 1962, 371-375

TEXT: On the basis of N. N. Koton's investigations (Dokl. Akad. SSSR, 109, 1953) the effect of oxygen on the polymerization of methacrylate (I) and acrylonitrile is studied at 30-50°C in the presence of dicyclohexyl mercury (II), diisopropyl mercury (III), diethyl mercury (IV) and diphenyl mercury (V). The compounds do not dissociate at room temperature. The compounds decompose rapidly at 30 and 50°C. Unstable compounds which initiate the polymerization at 30 and 50°C are formed from oxygen and II compounds. With the increase of small amounts of oxygen has an inhibiting effect. Its increase first accelerates polymerization owing to the decomposition of organometallic card 1/3

S/190/42/004/C03/CCE/023
B110/B44

Initiation of vinyl polymerization ...

compounds and to the inhibiting effect of oxygen. Increase in oxygen pressure reduces the molecular weight to a constant value. Maximum conversion corresponds to constant minimum molecular weight and probably also to a maximum content of radicals formed. $r_1 = 0.9$, $r_2 = 0.9$ holds for 6 hrs copolymerization of styrene and I at 50°C initiated by 0.3 mole% of II and in 14 hrs copolymerization of acrylonitrile and I at 30°C initiated by 0.3 mole% of III. Since these relative activities are similar to those of free radical copolymerization, II and III cause free radical polymerization. In the absence of O_2 , hydroquinone additions of 50-500 mole% of the initiator reduced the conversion degree of I from 12 to 2-%, and the molecular weight from 1,500,000 to 300,000. An induction period of 5.5 hrs was found in the polymerization with IV in air. There are 3 figures and 4 tables. The most important reference to English-language publications reads as follows: F. M. Lewis, F. R. Mayo, W. F. Hulse, J. Amer. Chem. Soc., 67, 1701, 1945.

TITLE: Nitrogenous peroxide compounds as initiators of polymerization of vinyl monomers. I

PERIODICAL: Vysokomolekulyarnyye soyedineniya, v. 3, no. 12, 1961,
1794 - 1799

TEXT: On the basis of literature data stating that the initiating activity of peroxide compounds is intensified by addition of amines, the authors investigated the initiating effect of peroxides which already contain amine or amide groups in their molecules. Initiators were synthesized as follows: Cumyl-N-phenyl peroxy carbamate and hexamethylene-N,N'-bis-d-cumyl-peroxy carbamate according to Refs. 6, 7 (see below), the other peroxide compounds according to A. Rieche et al. (Chem. Ber., 92, 1206, 1959). N,N'-bis-(cumyl peroxy methyl)-urea was first synthesized by the authors: urea was shaken in 2 N H₂SO₄ with cumyl peroxide and formalin. After 12 hr storing in the refrigerator, the peroxide crystallized out.

Nitrogenous peroxide.

(melting point 120 - 121°C, yield 42%). The initial rate of polymerization of monomers cleaned in vacuum by distillation: methyl methacrylate (MMA); methacrylic acid (MA); acrylonitrile (AN); styrene (St) was measured dilatometrically. Results are given in a table. Polymerization was achieved in bulk. A distinct dependence of the initiating effect on the structures of peroxides was found. Peroxides with group $>\text{N}-\text{CO}-\text{O}-\text{O}$ were more active than peroxides with group $>\text{N}-\text{CH}_2-\text{O}-\text{O}$. Furthermore, the nature of the monomer especially the chemical nature of the groups between the nitrogen atom and the peroxide group influences the initiating effect of peroxides. The optimum temperature for polymerization also depends on structure of monomer and peroxide. Peroxides with group $>\text{N}-\text{CH}_2-\text{O}-\text{O}$ were most effective at elevated temperatures (St, >120°C) while the optimum temperature for cumyl-N-phenyl-peroxy carbamate (for MMA, MA, and AN) was 20 - 60°C. The insignificant activity of this compound in polymerization of styrene (120°C) is ascribed to its low temperature stability. The initial rate of polymerization depended on temperature according to the Arrhenius equation. The activation energy was 11.4 kcal/mole. For the dependence of the initial rate v_{in} on the concentration c_0 of the initiator

II. Study of photolysis by radioactive carbon C¹⁴PERIODICAL: Vysokomolekulyarnyye soedineniya, v. 3, no. 6, 1961,
877 - 881

TEXT: The study of the gases separated during light aging of polymers (e.g., polymethyl methacrylate - PMMA) is of importance in the clarification of destruction reactions and in the development of rational stabilization methods. An attempt is made in the present study to explain the formation mechanism of photolysis gases by C¹⁴, and the relationship between the mechanism of gas evolution and the photolysis of PMMA. PMMA samples labeled with C¹⁴ in different positions were subjected to block polymerization at 45°C with subsequent heating to 110°C, and then freed of the monomer by three-fold precipitation with methanol from acetone solution. The powder samples with linear particle dimensions of 0.5

- 1.5 mm were irradiated with the TPK-2 (PRK-2) mercury quartz lamp in glass boats at $\sim 10^{-6}$ mm Hg residual pressure for 50 hr. The pressure there increased to 6-7 mm. The reaction vessel 6 for the combustion of the gases formed was then fitted to the device shown in the Fig. Stopcock 2 was closed and the whole plant was evacuated by means of a rough vacuum pump through the stopcocks 3,4,5. A part of the gases was then conducted into vessel 7 by opening stopcock 2. The necessary amount of oxygen flew in through stopcock 9. The gas to be analyzed which was mixed with oxygen in vessel 8 was oxidized over copper oxide at 750 - 850°C, carbon dioxide was collected in 12, the water vapor in 11. In vessel 13 the radioactive carbon dioxide was diluted with ordinary CO₂ up to the volume required for filling the counter, radioactivity was measured in 14. Gas evolution in the presence of oxygen and nitric oxide was studied in a similar way. The gases could be quantitatively burned in the plant. The macromolecular chains may be ruptured by primary action

of light and by secondary reaction, as the radiant energy of TPK-2 (PRK-2) lamps of 120 kcal/mole is sufficient for the rupture of chemical compounds. In the case of UV radiation the ester groups are most sensitive. Their separation gives rise to low- and high-molecular radicals:

The mass spectrum analysis of the gases formed in the photolysis of PMMA in vacuo disclosed a short lifetime of the low-molecular radicals owing to their reaction with the surrounding molecules. The formation of methyl formate was also confirmed by mass spectrum analysis (characteristic peaks): $\text{COOCH}_3 + \text{RH} \longrightarrow \text{HCOOCH}_3 + \text{R}'$ (R' = macroradical). UV radiation

destroys methyl formate under formation of a complicated gas mixture. The separation of lateral ester groups is supported by the activity data of the decomposition gases of MMA-3 and PMMA-4 samples. As the activity decreased after three-fold reprecipitation it is assumed to be due to impurities. No monomeric methyl methacrylate molecules are split off in this connection. In the PMMA-1 and PMMA-2 decomposition, the subsequent decomposition of methyl formate gives rise to the formation of CO₂ and other gases which react with the polymer chains and thus separate from the gas phase. In the photolysis in the presence of oxygen, carbon from the α -methyl group and a quaternary carbon atom were detected. The exact relationship between the reactions causing the macromolecular chain rupture (1) and those of ester group separation (2) could not be established. (1) can only be primary in the rupture of C-C-bonds at the quaternary C-atom like in the rupture due to electron action. When the α -methyl group is split off in the photolysis of MMA-4 (PMMA-4) in vacuo:

AUTHOR: Ryabov, B. O. (Ryabov, B. A.) (Moscow)

TITLE: Estimating the stability of self-oscillations in some nonlinear servo-systems

SOURCE: Avtomatyka, no. 6, 1964, 11-17

TOPIC TAGS: automatic control, automatic control design, automatic control system, automatic control theory

ABSTRACT: Based on published Soviet sources, conditions of stability of self-oscillations are considered in a servosystem which had n generalized linearly-interdependent coordinates and a coordinate σ with a relay characteristic (a servosystem with a z-shaped symmetrical characteristic). An inequality (16) is developed which describes the stability conditions. Orig. art. has: 28 formulas.

TITLE: Steady-state oscillations in relay systems with internal feedback

PERIODICAL: Akademiya nauk SSSR. Izvestiya. Otdeleniye tekhnicheskikh nauk. Energetika i avtomatika, no.5, 1962, 157-162

TEXT: The method of generalised coordinates is applied to the study of the modification of relay system self-oscillation parameters (period, amplitude) by means of internal feedback. The solution is developed on the interval between two successive operations of the relay, during which time the linear part of the system and the feedback circuit are isolated and have no mutual influence. They can then be considered as independent sub-systems and solved independently. A graphical method is used. There are 5 figures.

TITLE: Corrosion resistance and corrosion-fatigue strength of hardened ShKh 15 steel 32

SOURCE: Fiziko-khimicheskaya mekhanika materialov, v. 1, no. 1, 1965, 27-31

TOPIC TAGS: steel corrosion, steel fatigue strength, hardened steel, corrosion resistance, electroslag melting, electroslag refining, vacuum melting/shKh 15 steel

ABSTRACT: Comparative corrosion-resistance and corrosion-fatigue strength tests were made on samples of ball-bearing steel with different degrees of contamination by nonmetallic impurities and different densities. Six types of ShKh 15 steel (made by six different technological variants) were thus tested. A 3% NaCl solution was used as the corrosive medium. The corrosion resistance of electroslag and vacuum steels was found to be virtually the same and somewhat greater than that of the ordinary variety made in an open arc furnace. The 3% NaCl corrosive medium sharply decreased the cyclic strength of hardened steel. Steels subjected to electroslag remelting were found to be somewhat better in this regard. Fatigue tests on the six types of steel showed that the more aggressive the corrosive medium or more severe the testing conditions (preliminary

TITLE: Method for determining axial residual stresses in metal surface layers

SOURCE: Fiziko-khimicheskaya mekhanika materialov, v. 2, no. 1, 1966, 3-9

TOPIC TAGS: stress distribution, metal stress, steel / 45 steel, 40Kh steel

ABSTRACT: A method for measuring residual axial stresses in the surface layers of solid cylindrical specimens is presented. It consists of measuring with resistance strain gages the deformations which result during continuous etching of a semi-cylindrical portion of the rod and relating these deformations to the residual stresses. Based on the equations proposed by I. A. Birger (Ostatochnyye napryazheniya, Mashgiz, 1963), an equation for the residual stresses as a function of deformation and etching depth is derived in the form

$$\sigma_{res} = \frac{E}{\left[\frac{2(r-\delta_i) + \pi y_{r_i}}{I_{s_i}} l(\delta_i) - \frac{\pi}{F_{s_i}} \right] (r-\delta_i)} \frac{ds}{d\delta_i} + E \int_{\delta_i}^{s_i} A(\delta_{i-1}) \frac{ds}{d\delta_{i-1}} d\delta_{i-1}$$

Card 1/2

L 40-05-66

ACC NR: AP6009606

2

where

$$\Delta_1 + \Delta_2 + \dots + \Delta_n = \delta_i$$

and

$$I_{\delta_i} = \frac{\pi}{8} [(r - \delta_i)^4 + r^4]; \quad F_{\delta_i} = \frac{\pi}{2} [(r - \delta_i)^2 + r^2];$$

$$y_{\delta_i} = \frac{4[(r - \delta_i)^2 - r^2]}{3\pi[(r - \delta_i)^2 + r^2]}.$$

The derivatives $d\varepsilon/d\delta_i$ can be obtained from the experimental data, using parabolic approximations. The term

$$B = \frac{E}{\left[\frac{2(r - \delta_i) + \pi y_{\delta_i}}{I_{\delta_i}} I'(\delta_i) - \frac{\pi}{F_{\delta_i}} \right] (r - \delta_i)}.$$

can be constructed graphically to simplify the calculations. Sample curves of residual stress distributions in 20- and 150-mm diameter rods made of steels 45 and 40Kh are presented to demonstrate the procedure. Orig. art. has: 13 formulas and 4 figures.
